螺杆真空泵

Screw Vacuum Pumps

Elmo Rietschle S系列螺杆真空泵采用干式运行、无接触操作方法，不需要在泵腔内进行润滑。这可成为该产品的主要优势：工艺过程没有污染，泵的运行也不会产生污染。

性能范围广

我们的S-VSA、S-VSB和S-VSI螺杆泵可以实现0.05 mbar的极限真空，可以在极限真空和大气压之间的任何压力条件下工作。

坚固耐用的设计

在泵壳内，两个平行的螺杆转子（均为同步定时齿轮）向相反方向转动。气体在排出口方向被压缩。变速箱和机械密封环使用润滑油进行润滑。在泵壳内，通过冷却剂的连续流动进行冷却。

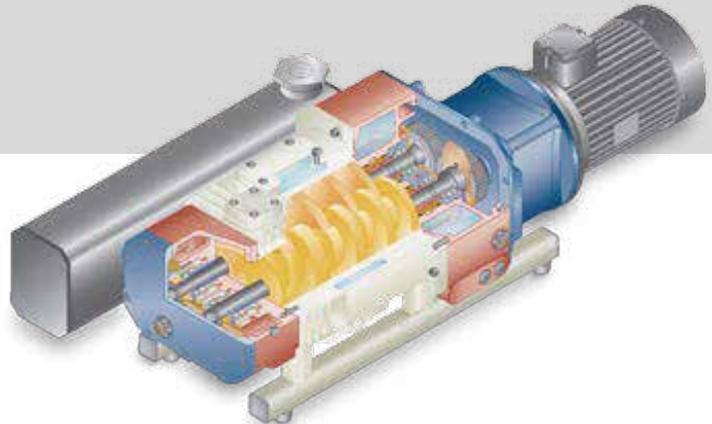

The dry and contact free operation of the Elmo Rietschle S-Series screw vacuum pumps requires no lubrication in the pumping chamber. This translates into major advantages: no process contamination and no pollution caused by the pump operation.

Wide performance range

Our S-VSA, S-VSB and S-VSI screw vacuum pumps achieve an ultimate vacuum of 0.05 mbar (abs.) and can operate at any pressure between end vacuum and atmospheric pressure.

Rugged and durable design

In the pump housing, two parallel screw rotors, both timing gear synchronized, turn in opposite directions. Gas is compressed in the direction of the discharge port. Gearbox and mechanical seals are oil lubricated. Cooling is achieved through the continuous flow of coolant through the pump housing.

螺杆操作原理

Operating Principle Screw

螺杆式真空泵是由两根螺杆(1, 2)组成, 一根右旋螺纹, 另外一根左旋螺纹。两根结合的非常密致螺杆, 无摩擦的向压缩腔(9)转动, 经由一根精密齿轮(3)同步。压缩腔和特别形状的螺杆形成了压缩室(4)。

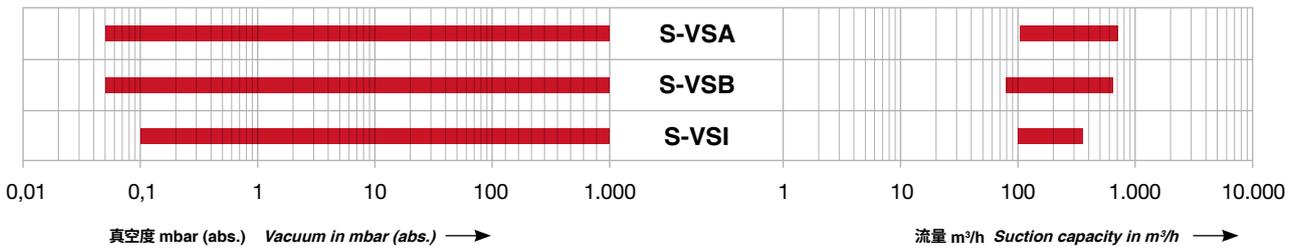

由于两根螺杆反方向运转, 与吸气点(5)连接的腔室被放大, 气体被输送至压缩腔。腔室沿吸气侧到压力侧轴向移动。在输送期间, 由于流量的增加使得腔室中大量的气体增加。压力侧的腔室沿着腔壁轴向移动, 体积逐渐减少直到螺杆(1)的前表面打开压力通道(6), 预压缩气体通过压力连接点(7)被排出。冷却水被获得用于冷却外面的腔壁(8)。部分规格的泵, 附加的冷却空气能被导入泵体。

A screw vacuum pump consists of two parallel, screw-shaped rotors (1 and 2), one with a right-hand thread and the other with a left-hand thread. Both screws turn in the compressor housing (9) without friction and at very tight clearances. They are synchronized via a precision gear (3). The compression housing and the special shape of the screws form the compression chambers (4).

Due to the opposite rotation of both screws the chamber connected with the suction p (5) is enlarged and the gas is transported into the compression chamber. Then the chamber moves axially from the suction side to the pressure side (arrow). In variable pitch models, the gas is compressed at each pitch change and cooled before the next pitch change, resulting in greater efficiency. On the pressure side the chamber is moved against the axial housing wall and the volume is reduced until the front surface of the screw (1) opens the pressure channel (6) and the pre-compressed gas is discharged through the pressure connection (7). Cooling is achieved using a water cooled outer chamber (8). For some pump sizes additional cooling gas can be introduced into the pump. (10).
